About

This will...

Set up HE's tunnel broker service.

Automatically finds your wan ip at boot using whatismyip.com

Automatically updates HE's endpoint on boot

Generates a radvd.conf on boot, and applies it automatically

Generates a executable file that can be used with cron to keep HE's endpoint up-to-date if you have a dynamic IP

My setup for reference.

Optimum Online Cable ISP

WRT610Nv2

v24-sp2 (Aug 12, 2010)

build 14929

You should have an account and tunnel created on the website. This post will not cover that. Install steps are below the script. This script will only work with /64 tunnels/addresses. Don't use it if you're using /48

Script

```
#v1.4 Feb 29, 2012
#*****
#Settings start here
#*****

#basic connection settings
SERVER_IP4_ADDR="enter ip here"
CLIENT_IPV6_ADDR="enter ip here"
ROUTED_64_ADDR="enter ip here"

#account info to auto update endpoint
USERID="enter your hex user id. NOT text username"
PASSWD="your plain text password"
TUNNELID="your numeric tunnel id"

#####Optional/Advanced Settings#####

#IPv6 OpenDNS IPv6 Resolver
```

IPv6_setup_Hurricane_Electric_Tunnel_Broker

```
ENABLE_OPENDNS_IPV6_DNS=1

#HE's endpoint verification server ip to add to whitelist
HE_VERIFY_SERVER_IP="66.220.2.74"

#WAN IP Source settings
#Set below to 1 to use internal NVRAM wan address instead of fetching it from a site
USE_NVRAM_WAN_ADDR_INSTEAD=1
WAN_IP_SOURCE_ADDR="http://automation.whatismyip.com/n09230945.asp"

#logging settings (set to /dev/null for no logging)
STARTUP_SCRIPT_LOG_FILE="/tmp/ipv6.log"

echo "starting radvd" >> $STARTUP_SCRIPT_LOG_FILE
radvd -C $RADVD_CONFIG &
fi
```

Install Steps

Installation steps:

- Change the settings in the beginning of the above script to your settings.
- Copy personalized script into Administration > Commands. Save as startup script
- Go into Administration > Management
- enable IPv6 and radvd. Leave the config box empty
- (Optional) enable cron and enter this into "Additional Cron Jobs"

Code:

```
* 4 * * * root /tmp/report.sh
```

The above line will auto update the endpoint daily at 4am. Change to personal taste

- Apply settings, wait for reboot

OpenDNS Setting

This setting will append the following two entries into /tmp/resolv.dnsmasq

```
nameserver 2620:0:ccc::2
nameserver 2620:0:ccd::2
```

These will give dnsmasq access to the OpenDNS Sandbox DNS servers. These will give access to IPv6 only dns entries. (And will also give you double 10s on test-ipv6.com ;)

Dnsmasq must be enabled (DHCP Server) or this will not work!

Also dnsmasq needs to be used for DNS.

On my working box, I have...

Under Setup...

Static DNS1 - 208.67.222.222 (*OpenDNS ipv4 dns server, not required*)

Static DNS2 - 208.67.220.220 (*OpenDNS ipv4 dns server, not required*)

Use DNSMasq for DHCP - Checked

Use DNSMasq for DNS - Checked

Install Steps

IPv6_setup_Hurricane_Electric_Tunnel_Broker

DHCP-Authoritative - Checked

Under Services...

DNSMasq - Enabled

Local DNS - Enabled

No DNS Rebind - Disabled

All clients have only 1 dns entry : 192.168.1.1 (My router's IP Address)

Reducing Script Size

The script size is increasing as new features and error checking is added. Your NVRAM might be too small to hold this script along with the other settings your router uses.

To get around this you could move the script to your jffs or usb partition then reference the script in Administrator > Command instead of copying the entire script.

If you do not have a JFFS or USB partition, you can remove all the comments from the script and you can replace all the variable names with single letters. Both of these will significantly reduce the size of the script.
